Erasmus Refletion Sheet The school of the future

Inquiry line: How might educational paradigms change in the next 50 years? Write about: 3 things learned 2 fun facts 1 question I still have

FOMIN_ANA   MAY 27, 2022 05:40AM

Hi, I'm Ana

I have learned that technology will revolutionize education. New spaces and possibilities will create completely different mindsets. Moreover, I suppose intellectual skills will no longer be the focus of the educational process. People will have to improve their soft skills, such as empathy, to achieve emotional balance. Teachers might choose to aim for their students' wellbeing above all.

It was amusing to think of the school under water or on the train. Also, impersonating future students or teachers made me laugh.

I also wonder if the timeless aspect of education - our Humanity - will still be there, at the core of everything.

What's up, I'm Dan!

I'm really happy we managed to do this project. This allowed me to learn about how Artificial Intelligence will change the educational system completely, by using implants, automatizations. Moreover, I realised that the future students are looking forward to feel, to experience things instead of casually learning just facts. I believe that students will also be highly influenced by the way they are going to learn, for example online in contrast with face to face classes.

I got the chance to get new information, while also having fun. I met people, had fun, partied with them. Everything was great and the fun facts put everything together. It was fun to see ideas such banana/train school or to do drama games.

However, I'm wondering how much the school will change in the future. And after a presentation I have watched, I have a question. We can predict that A.I. will take over. But if A.I. is programmed by computer scientists, and it will also get to be so powerful, will A.I. also replace the need for coding skills?

Hello, I'm Chris

I hold the belief that digitalisation is going to play a major role in which young students are educated. We live in a time in which information is available to everyone through the internet. It is almost unthinkable how quick we have managed to evolve intellectually, however I have learned that people's capacity to empathise is slowly dwindling due to our stressful, fast paced lifestyles. I think that in 50 years time schools will focus more on the emotional development of human beings, since it's the only aspect of our lives that gets ignored increasingly by the day. I can't help but wonder if even after the world as we know it ends; will our consciousnesses be completely gone, or will we discover a way to transcend our physicality into this digital world that we continuously develop?

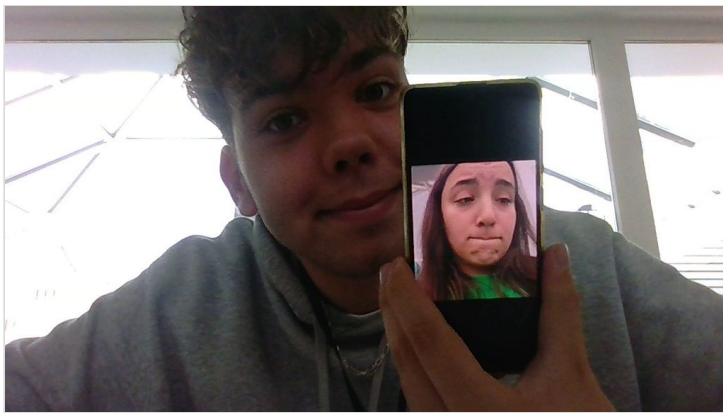

Hi, I'm George:P

I've learnt that everyone can reach their dreams. They just want to be motivated through the school year, and the new school system helped a lot with this, because there were so many problems with this in the past.

I've learnt when people are learning that kind of subjects, in what they are interested, can be more productive, because they don't have any boring classes.

I think that the most important thing, what I've learnt is that without the artificial-Intelligence the students wouldn't have this much opportunities. Because of the covid, the students couldn't go to school, and without the app meet or discord and stuffs like that, they could not learn. It was so funny to think about these kind of schools. You know the school under the water, or in the rainforest, Antarctica etc.

It's such a big question for me yet, what will be in the remoter future?

Because it's okay, that we are thinking about the school of the future, but there will be future after that future, what we are talking about.

Hi! I am Lilla

In these days I have learnt that the development of the technology will cause multiple changes in school. I think it is good, we can learn more effectively. But we should keep some regular methods in learning and teaching. Example we will need human teachers.

I really enjoy the debate here, it was thoughtful.

In my sight, we should teach by mixing the two methods: the regular teaching and the modern teaching, because they all have their disadvantages. We have to use both to each the best results in our learning.

I am still wondering if how the next generation will handle the technology and the old-fashioned school in the same time.

It's Kalina here

I learned about the future of the education is based on us - young people. The technology will be used more and more often and the creativity and independency is going to be most important skills to develop. The uniqueness of students must be the priority. Fun fact that is super interesting is the metaverse coming to our lives. Did you know penguins have knees? Crazy, isn't it? I'm extremely exited to see how the future is going to look like. My question is: How the leak of human touch is going to influence people's lives?

SPOTIFY

Hi!I'm Delia

I learned a lot about the impact of virtual intelligence on education and the way we live. Students will be enabled to access any piece of information faster and therefore develop any skill they might want to have. Children will be more engaged in the subjects that are being thought in school. Consequently, their academic experience will be enhanced.

I was really surprised to find out about the unusual jobs that might be popular in the future and it has really got me questioning my career choice.

I am still very curious about the future of humans' emotional intelligence and I really look forward to seeing what will eventually happen.

Barka
Jan Paweł II

Hi, I'm Dominika

I learned a lot about career of the future and how to build business in my adult life ex.: to do a important step I must be confident, even if I achieve something I must to learn more and more and never stop, the most important thing I learned is that everybody should love themselves, because everyone have beautiful soul. Fun facts I learned: penguins have knees and vampires do not like garlic. My question is: Why Romanian people like meat so much?

Hi, I'm Emilia

I have learned that technology is very important for the development of education. Using technology at school will save time and it can make lessons more interesting for the students.
I liked this project because I got the chance to get new information and to make new friends at the same time.
I'm extremely curious to see how the school is going to be in the future.

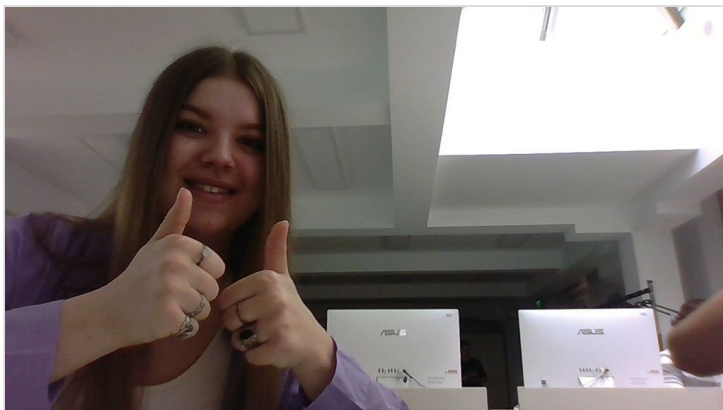

Hi, I'm Aga

Thanks to the Erasmus project I learned that communication between people is essential and we can always reach an agreement if we really put our hearts into it. Also, people should appreciate differences between them, because it's beautiful and valuable that we all vary. A funny thing about the Erasmus week is that I got so used to talking in english, that sometimes I speak it even to my polish friends. Another fun fact is that I signed a contract and got employed as a video games designer (during a

simulation of course, but I'm still proud). The remaining question though is: why are romanian songs so random? I mean I'm living for it, but it's really extraordinary.

Hi, iam zuza:)

I've learnt a lot during Erasmus project :) For example i improved my English skills and I met new people. I also learnt a lot about Artificial Intelligence, thanks to the conference. We were discussing a lot about schools in the future and I have to say that it was really funny and entertaining. We were pretending that school is on the tree and we have to learn about "bananaconomy" and so on. On the second day we were thinking about "how school will look in 50 years?" and we had so many different ideas, so I'm curious if any of these suggestions will ever become reality.

Hello, I'm Jakub

During my days in Romania I've learned that virtual learning will become a much more popular way of learning, since it can provide a lot of different opportunities, especially all kinds of equipment that you wouldn't be able to obtain in the real life. I also noticed that it's important to have a good relation with your teachers, because they can always aid you in tough times or if you don't know something. It's also very crucial to be on good terms with your classmates, be nice to them and keep in touch with them.

Some fun activities I've done is the drama about a school in a train or the job interviews in front of the people.

But I still have one small question: I wonder when will we finally see the robots actually replacing humans?

SPOTIFY

Hi, I'm Ola

I learned that the future will be focused on technology subjects more than on arts. That's why I decided to invest in kremoweczka jp2 NFT. I think this crypto currency will be the most rewarding one but only if u buy it at exactly 21:37. This whole project made me realize that I no longer want to be just an ordinary girl right now I'm a business man and I do business. After 4 days spent here I menaged to change my whole personality and I stopped carrying about ordinary people problems - they won't pay for my tesla. Also I bought 50% of shares in Amazon and Jeff Bezos is currently sending me pictures of him spending time on some golf court randomly. I'd love to tell u something more but business is business and I have to go to some meeting with Bill Gates or something idk. (sorry for not putting a question but If I wanted to know something I would just google it)

Hi, we're Mara and Victoria

In this project we've learnt many important things. We've learnt about artificial intelligence and how might a school in the future look like. We think that our expectections are amazing and may be turned into reality sometime.We also learnt that we should combine the nature with the technology and make it an amazing place to live in.

The fun facts where at every step and we experienced a wide range of things that made us laugh a lot🤣❤️
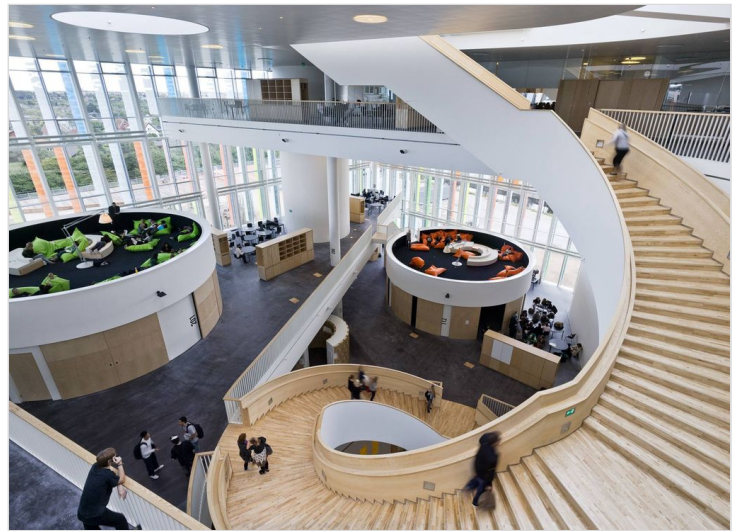

But at the and we still have some questions.....will we get the chance to experience all the amazing things? If not, will those who will experience them enjoy them? 🙌💕

Hi, I am Jasmine

I have learned that technology is already so important in our lives so it will change education. In my opinion education will go through big changes, but in 50 years we will still have human teachers. Moreover, I think there will be more online lessons, especially in universities.
It was funny to think about impossible types of schools, like banana schools or schools under water. Adding that it feels so weird that our future really depends on us so we need to be creative and come up with ideas like these.
After all, this question still remains in my head: What if monkeys will really help the students in school?

Hi, I'm Irena

I have learned about the endless possibilities that a technological education system brings and so much more information about artificial education, but the most important things that I have learned in this project is communication between people from completely different social settings. Although I had some doubts about the way we would get along, the amazing stories I have heard from everyone are, for sure, something to remember.
I am so excited to spend more time with these people and to get to find out more about them.

Hi,I'm Denisa

One of the things I have learned about educational changes in the future is that technology will be the main method of teaching.I hold belief that the subjects will change in various ways,from the interaction between people,and the relationships with the teachers,to the environment in which people study.
I am really keen on finding out what developments will affect the future in a better way,and how the artificial intelligence is going

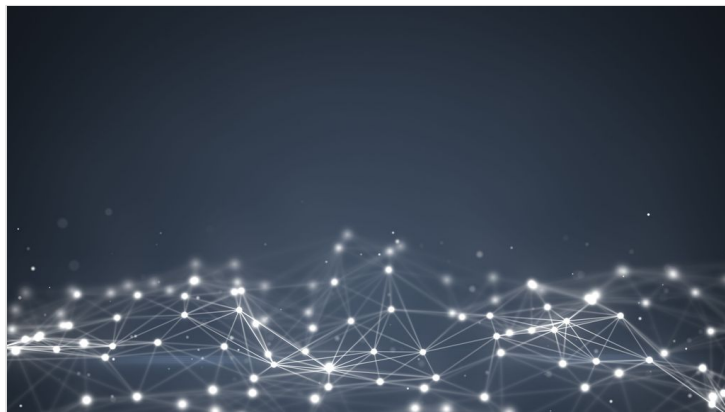

Hi, I'm Raluca!

I have learned that technology will definitely take over what we are used to seeing now. It is a thing that we cannot control no matter how scared or not ready for it we are. I have also realized that we should not worry about the changes that will take place in the future, because it is something we can't control. People should not be scared of change but embrace it. After all, one last thing I am sure of is that life will be easier with technology taking over.

I found it very nice that we could have fun together and discuss such a serious topic in such an entertaining way. Also, the creativity some of these people I met has is unimaginable.

I still have a question in my mind and that is if people are going to act in a different way because of the often use of technology in our daily lives.

Hi, I am Adri

I have learnt lot of things. The first, there is no such things as impassible. Sometimes the people need more support from friends, if you don't get it from your teacher.
The second, every subject important, but not all of them are needed to achieve your goals. The third, I need to be creative, because it can run into to lot of difficulties in a persons life and sometimes need to be creative to solve it.
I think every people other and other but we need to learn how we can work in teams and we need to be patient too.
It makes more difficult the Artificial Intelligence and the digital world.

Hi, I'm Maciej

I've learnt a lot during this programme. I extended my knowledge about Artificial Intelligence, how it affects on our life, I gained some acting skills and of course improved my english vocabulary. Also we've made some funny activities which I enjoyed so much. I haven't known about some things before so it was quite unusual. Additionally, I've made good friends and had very memorable time here. I had a big fun during concert and parties. I'm wondering, how the future will really look like in 50 years?

Hi, I'm Flora

During this project I have learned that changes in education are inevitable due to the development the technology. That isn't necessary a bad thing because we use these digital things everyday and can be really helpful at school. Students can learn more effectively and at the same time have fun doing it. I also learnt that we also have to keep regular methods. I think the best way would be to combine both methods.
It was interesting to see what kind of jobs there might be in the future. It was also funny how impossible schools could be managed.
I'm wondering how the educational system will change in a few decades.

Hi, I am Andrei

Throughout the duration of this project I have learned that technology has the ability to revolutionise the education process, thereby heightening the student's performance. Moreover, I have learned that regardless of how technologically advanced we may be, humanity will still have its place.

It was a fun activity, and I am glad that I had the opportunity to contribute.

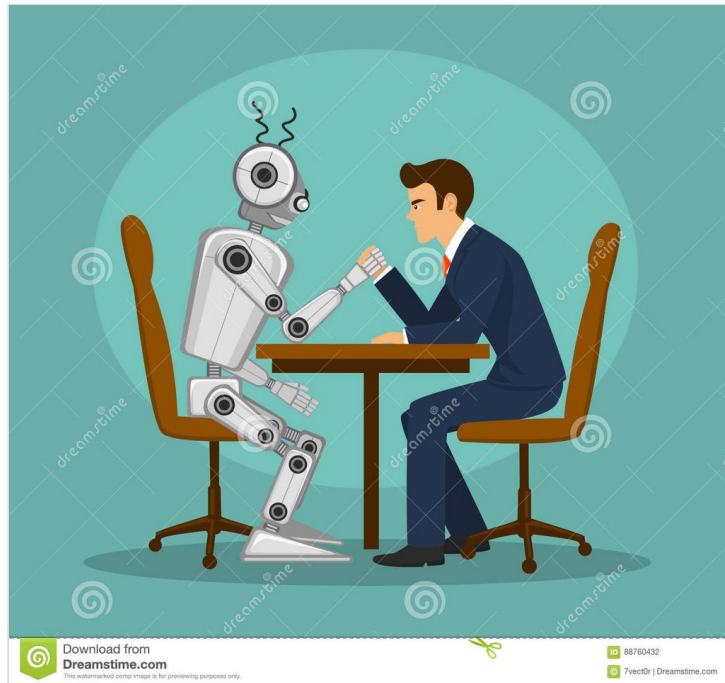

Hallo, I am Maria and Luci

I got the point that technology will be the highest priority in schools and how artificial intelligence will be at everyone' s hands in one day. I have also envisaged how might the future school will be like in a few years time and I am really excited how it will turn out. However, the impact that it will have on the next generation will only lead to good results in my opinion.
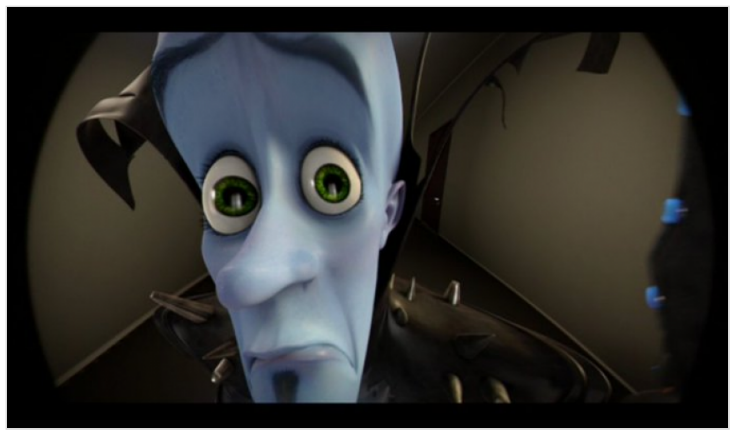

I am so glad that I got the chance to meet new and interesting people with different mindsets that made me question many things, but in a good way :)
Moreover, communication is essential so that i reduces misunderstandings and it will also develop strong relationships.
I loved some of the activities thanks to their creativity and I cannot wait to see more of them.
I am really curious how the world will be in a couple of years and how long it will take people to fulfill their dream of living in a full digitalized environment.

Hi, I'm Balazs

If there's anything I really learned while taking part of the Erasmus project in Romania, it's that current way people are educated is outdated. It has been for about 70 years as some of my fellow students have mentioned it in their presentation. Education as we know it has quite a high possibility of transforming itself completely. AI will take a huge role in education but it won't force all teachers out of their jobs. As statistics we've seen thus far show, people learn things fastest if the way they get information from both human teachers and some sort of technological gadget, may that be AI, AR or anything else.
Sadly as statistics have also shown, human interaction is necessary for people to get the best results in school. Technology (and AI in particular) isn't advanced enough to provide the necessary amounts of care and information to a student. Maybe one day we'll see an AI that can make their own decisions, capable of free thinking and making creative, new ideas. My question that I still have is also about this. I wonder if there will ever be an AI advanced enough to meet the "criteria" I've listed above, like creative thinking and whatnot. Future technology and the technology of education has lots of possible way it could evolve, we will just have to wait and see how it goes. I'm looking forward to a brighter and better future together.

It's Paulina

I have learned that technology is very usable and can greatly improve education system. For example we can study from anywhere in the world.
It is very important to keep a young teaching staff and conduct workshops and lectures for them to keep up with the changing technology.
During this week I found out that penguins have knees and bananas is a good currency.
Teleporting is fine when you are late for an exam but I don't want to be electrocuted.
For years it has been said that soon flying cars gonna be popular. But so much timed passed out and it is not. So my questions is: when there will be such a big improve in technology, after which robots gonna be everywhere and etc.

Hi, I'm Andrei

As the time goes by, Artificial Intelligence will surely begin to have a profound effect on the educational process. In this

project i have learned a lot of things regarding this particular prospect.

To begin with, I have discovered the fact that some technical devices will begin to substitute the traditional forms of learning. In this way the students will be more engaged in what they are doing, thus enticing a new approach.

Another aspect which I learned was strictly related to the conference I participated. It was said that the qualities needed to cope with the future problems involve being able to work in teams and to be creative.

Moreover, in the future some of the present jobs will just disappear, so you have to gather a lot of knowledge in order to adapt to the society's necessities.

Some of the information has also generated a lot of interest. I just discovered that in the next 50 years you could be a drone manager or even a photo removalist.

I am still wondering how will we get along with the technology in the near future, but that problem I think only the time will tell.

Hello, I'm Ilinca <3

During this project I learned that technology will revolutionize education and bring it to a completely different, superior level. It is important to speak honestly about the advantages and possible disadvantages of certain projects, and during our debates and discussions we did exactly that. Even though change is difficult sometimes, technological advancements can drastically improve the quality of our education and our lives in general, so we should welcome them and make efforts in bringing them to as many people as possible. I think the project motivated many of us to invest more time in learning about modern technology and using it in our lives by showing how useful it is. Step by step, we can build a brighter future.

Hi, I'm Imi

Erasmus was a great experience and we learned a lot of new things

I think that technology will have a great impact on education. With technology a lot of classes could be a better experience, the idea of visually seeing the experience sounds much more interesting than reading it form a book.

I'm sure that there are going to be a lot of new teaching methods in the future but in my opinion teachers won't be replaced completely.

I am glad I had the opportunity of joining such a thing as Erasmus

Hi, I'm Balazs

To my mind , there will be a lot of new methods and possibilities in the future of education, because of the technological improvements. I think robots and artificial intelligence will play a big role in or future. There will be new subjects, and I also think books will disappear because of our electrical gadgets. During erasmus ,I've learnt so many things about our future both in education and careers, I've learnt that we must be confident if we want to achieve our goals. My question is that why Romanians have such a good water ?

Hi, I'm Eszter

 I don't really want to talk about the artificial intelligence. I know it's important but I think this Erasmus project is more than that. I've learned how to be patient and respectful.
 I've learned that everything is possible if you put your heart into it and you don't have to be stressed about everything because life goes on and on.
 The most important i've learned, we have to accept each other. And I still wonder if we are going to see each other ever again, i hope so. 💋

online platforms and etc.

In my opinion the most important thing is to give students many ways they can develop in. The system should be more focused on the individuals. Their interesting, needs, talents and skills.

In really interested how the humanity will change in the future. How much the artificial intelligence will influence our everyday lifes? I hope that not to much. We are social creatures, so as humans we need face to face contact. It is essential to build our emotional intelligence also. It's just not possible without it.

maja :)

I think that our school system needs some changes. Unfortunately it's not that easy to make a revolution. For example Finnish education system known as the best in the world took several dozen years to properly exist.

Technology can help with that, but also can create some new problems. Artificial intelligence and new technological stuff gives us really huge range of new solutions. Our generation had a chance to deal with online education during the covid. First it was really hard to get used to it. Over time we've managed. This whole thing created new educational options. For example: recording lessons (then you can come back to the lecture), using
